

<b>PR2.A – TEACHING SOURCES</b>	
<b>Title</b>	TETRAGLE RATING: $(a+b)^2 = a^2 + 2ab + b^2$
<b>Duration</b>	1 session
<b>Age Group</b>	14-15
<b>Dimension of the advised group of students</b>	15 - 20 students, divided in 5 groups
<b>Area</b>	<input type="checkbox"/> Area 1: Reading, writing and literature <input checked="" type="checkbox"/> Area 2: Math <input type="checkbox"/> Area 3: Second language learning <input type="checkbox"/> Area 4: Sciences and geography <input type="checkbox"/> Area 5: Soft skills
<b>Specific objectives</b>	<p><i>The mathematics course should be accessible and enjoyable to all students. Through observation and interaction, students should be able to discover and understand that <math>(a+b)^2</math> differs from <math>a^2+b^2</math> and ultimately deduce what <math>(a + b)^2</math> equals.</i></p> <p><i>The students' cooperation in groups, observation, observation skills, the observation, reflection, the discovery method and critical thinking help</i></p> <p><i>The students' understanding and achievement of the objective of the lesson.</i></p>
<b>Needed Materials</b>	Computer or laptop, internet, notebook and pen
<b>Software</b>	<i>The activities are carried out online and students can take notes if they wish.</i>
<b>Description</b>	<i>Students are asked to find out whether the representations <math>(a + b)^2</math> and <math>a^2+b^2</math> are equal or unequal. At the end they should be able to prove that the equality <math>(a + b)^2 = a^2 + 2ab + b^2</math> holds for any values of a and b. They have the opportunity to find out in two ways either algebraically or geometrically.</i>
<b>Procedure on how to put in practice</b>	<p><i>Students who choose the geometric mode are given two activities. In the first activity they are given three squares with sides a, b and <math>(a + b)</math> respectively, where a and b are positive numbers. First, they calculate the area of each square and observe whether the sum of the areas of the side squares a and b respectively, where a and b are positive numbers, equals the area of the side square <math>(a + b)</math>. They experiment by moving the two cursors a and b that change the sides of the squares and record their findings.</i></p> <p><i>In the second activity, students can move points E, A, B and observe what happens. Discover geometrically what the representations <math>a^2</math>, <math>b^2</math>, <math>a \cdot b</math>, <math>(a + b)^2</math> express, and what the representation <math>(a + b)^2</math> equals. In algebraic mode, students are asked to give various values to a and b and to test whether the equality <math>(a + b)^2 = a^2 + 2ab + b^2</math> holds for any value of a and b. Finally, they can prove the equality by doing operations in their notebook:</i></p> <p><i><math>(a + b)^2 = (a + b) \cdot (a + b) = \dots</math></i></p> <p><i>The identity <math>(a + b)^2 = a^2 + 2ab + b^2</math> is proved!</i></p>
